

New “Order” REST API and Tracking Method

A synchronous REST API is now provided to enable third-party support for EDGE order functions. The **Order** API currently exposes a new method – “GetOrderTracking” – to carry out the associated order function via a REST service in JSON format.

Enhancements	
1.	The Order API's “GetOrderTracking” method is now provided for use in retrieving tracking information about EDGE sales orders.
2.	The “GetOrderTracking” function has been added in the “order” module under “service” on the System Admin>Merchant>Access Types>Access Type Details>Manage Access>Module Access page.

Business Benefit

The new API provides third-party access to order-related information using the latest integration techniques.
