

EDGE Activity Log Tracks Business Function Usage

The EDGE **Activity Log** now supports tracking and auditing of EDGE user activities performed via EDGE business functions – that is, the actions that are performed as follows:

- Within EDGE list pages and reports that have been implemented with JP-Grid functionality
- Using the EDGE bulk refund process
- Using the EDGE autoship process via the REST Autoship API
- Using the REST OpenTools API for inbound messages
- Using the REST Dynamic Fields API to update dynamic fields
- Using the REST Data Access API to get information about sales orders, return orders, work orders and ASNs.

Enhancements	
1.	Business function usage can now be tracked in the System Admin>Merchant>Activity Log .

Business Benefit

The ability to track actions performed via EDGE business functions gives merchants a more complete view and understanding of their user activities for auditing and troubleshooting purposes.
