

Improved Processing of Address Validation Exceptions

Orders that fail the address validation process can now be re-evaluated and approved in bulk via a scheduled task. Such a task is able to find orders with address validation exceptions only and retry orders that show code/connectivity issues. When successful, the task can auto-correct the address, if applicable, and approve the exception, resulting in a new order status of Backordered, Reserved or Approved.

Enhancements	
1.	EDGE has improved the ways in which address validation exceptions are processed.

Business Benefit

The ability to automatically mass reevaluate order address exceptions reduces or eliminates the need for manual intervention.
